ABSTRACT 1

A rear gate opening and closing apparatus includes a gas stay for biasing a rear gate in an opening direction, a motor 3 for actuating to open or close the rear gate, a clutch for 4 connecting or disconnecting the motor with the rear gate, an 5 encoder for detecting the position of the rear gate, an operating 6 switch for operating an opening and closing motion of the rear 7 gate, and a control means for controlling the motor and clutch to automatically open and close the rear gate. The opening and closing speed of the rear gate is controlled based on a detection 10 signal of the encoder.
